SAMI Assignment:
Interaction Audit & Redesign Challenge

Scott Schmidl
sschmidl3@gatech.edu

This assignment includes a survey — please complete it:

Delete this notice before submitting.

***Abstract*—**(Optional) Replace this text with a brief summary of your audit findings and your proposed development roadmap for SAMI. Delete this entire abstract block if you choose not to include one.

1 THE INTERACTION AUDIT

1.1 Matchmaking recommendations

Evaluate SAMI's matchmaking recommendations. Report what SAMI recommended, then assess: Were the recommendations appropriate? Did the matches help you meet new people?

1.2 Explanations of reasoning (#samiexplain)

Ask SAMI to explain its reasoning and recommendations by adding #samiexplain at the end of your message. Report what it said, then assess: Are the explanations useful? Comprehensive? Comprehensible? Do they make SAMI more transparent?

1.3 SAMI's model of you (#correctme)

Ask SAMI what it knows about you by adding #correctme at the end of your message. Report its model of you, then assess: Is it correct? If not, provide a correction update and ask SAMI to revise its knowledge of you. Did it revise correctly?

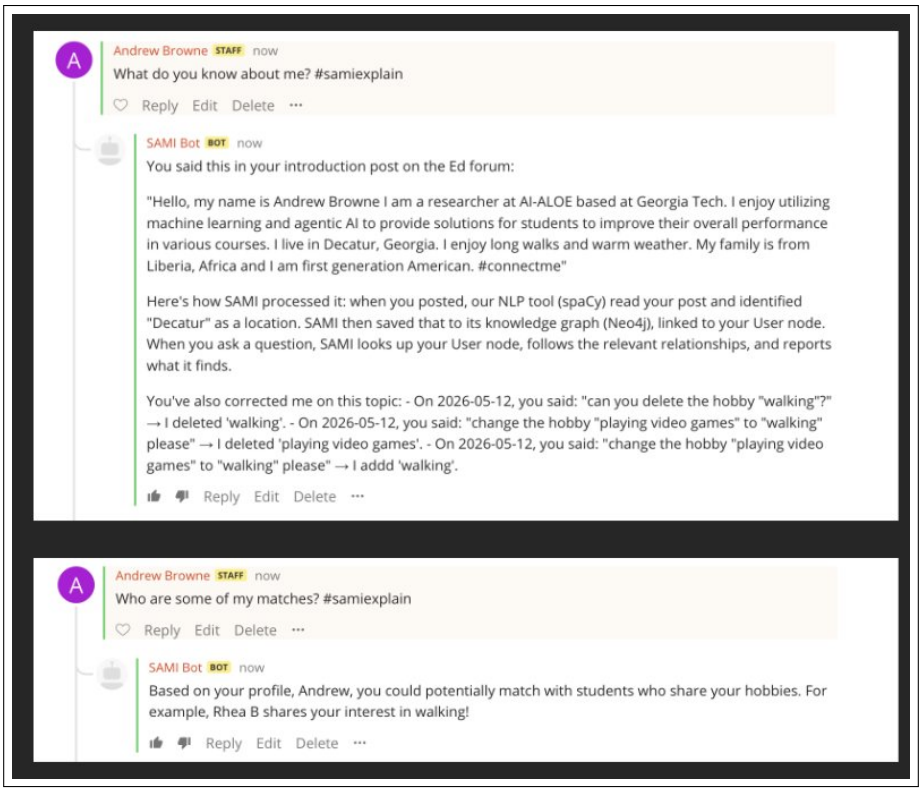

Figure 1—Example `#samiexplain` interactions. Adding `#samiexplain` to the end of a message prompts SAMI to explain the reasoning behind its answer or recommendation.

1.4 Explanations of revisions

Ask SAMI to explain the revisions it made to its model of you. Report what it said, then assess: Are the explanations useful? Do they increase your trust in SAMI?

1.5 Reflection on performance

Write a short reflection on SAMI's overall performance based on the audit above. What are the biggest limitations, shortcomings, or gaps you noticed? These findings will motivate your redesign in Part 2.

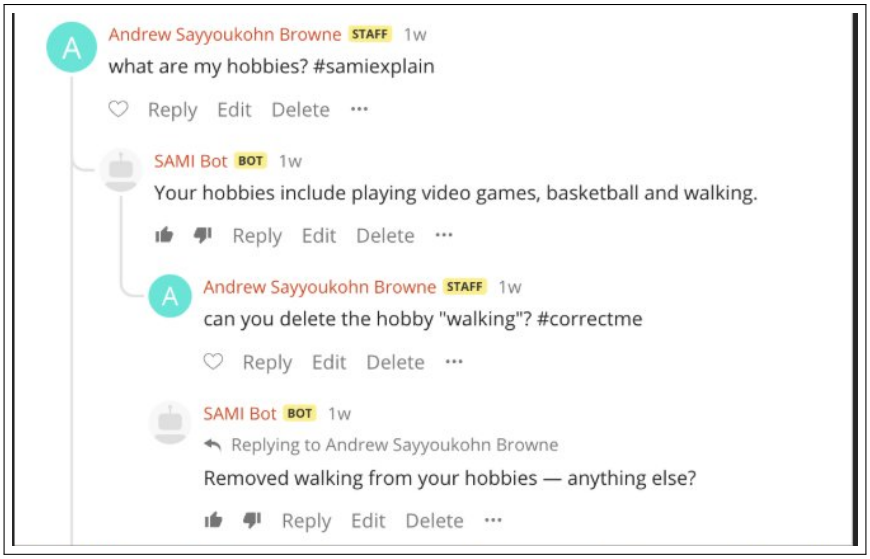

Figure 2—Example `#correctme` interaction. Adding `#correctme` to the end of a message lets you correct SAMI's model of you (here, removing "walking" from the user's hobbies).

2 THE REDESIGN CHALLENGE

2.1 Component selection

State which of the three components you will prioritize: Knowledge Graph (KG) Expansion, Matchmaking Logic, or the Interaction & Feedback Loop (you may choose one or more). Briefly justify your choice based on the limitations you found in Part 1.

2.2 The critique

Provide a clear diagnosis of why the current version of SAMI fails in your selected component. For the Knowledge Graph, describe and critique SAMI's knowledge graph. For Matchmaking Logic, describe and critique how SAMI connects you with others. For the Interaction & Feedback Loop, summarize your interactions and critique them from the perspectives of transparency and trust.

2.3 The high-level vision

Describe your high-level vision: What does "success" look like for this component by the end of the semester?

2.4 The technical roadmap

Provide 3–4 concrete implementation steps for your selected component. Incorporate your specific proposal: new Entity Types or Relationships (Knowledge Graph), a new process or heuristic (Matchmaking Logic), or a new feedback loop describing how SAMI should explain itself and update based on your feedback (Interaction & Feedback Loop). For example: "Step 1: Scrape LinkedIn API to enrich entity attributes; Step 2: Implement a Vector Database for faster relationship querying..."

3 REFERENCES

4 APPENDICES (OPTIONAL — NOT GRADED)

IMPORTANT: This section is entirely optional. Nothing in the appendices will be used in grading. All graded content must appear in the main body (Parts 1 and 2). Appendices are provided only for optional supplementary material (e.g., interaction transcripts, screenshots, or extended analysis) that may help your classmates and grader give better feedback. If you have no appendices, delete this entire section.

JDF FORMATTING EXAMPLES (DELETE BEFORE SUBMISSION)

This section is provided as a reference for JDF formatting conventions. Delete it entirely before submitting your assignment.

Figure example

To include a figure (e.g., a SAMI screenshot or a roadmap diagram), uncomment and adapt the code below:

To reference a figure in text: "As shown in Figure 1..." (use `\ref{fig:your_label}` once the figure is uncommented).

Figures should always be centered, referenced in text, and include a descriptive caption beneath them. If the figure has a white background, consider adding a

$\frac{1}{4}$-point black border for legibility.

Table example

Table 1—Example table for a technical roadmap.

Step	Action	Expected outcome
1	Scrape LinkedIn API to enrich entity attributes	Richer node metadata in the KG
2	Implement a vector database for relationship querying	Faster, semantic match retrieval
3	Add a feedback-capture step after each match	Continuous model refinement

Table captions go *above* the table ("figures at the foot, tables at the top").

In-line text formatting

Bold and *italics* for emphasis. Hyperlinks: link text. In-line code: `code here`. Superscripts $^{\text{like this}}$ and subscripts $_{\text{like this}}$.

Quotes

In-line (fewer than 3 lines): "Heavy use of peer grading would compromise [the school's] reputation" (Joyner, 2016).

Block quote (3+ lines):

> "Whether or not the grades generated by peers are reliably similar to grades generated by experts is only one factor worth considering, however. Student perception is also an important factor."

Lists

Bullet points:

- First bullet point item
- Second bullet point item

Numbered list:

1. First numbered item
2. Second numbered item

Citations

Parenthetical: `\citep{key}`. In-text: `\citeauthor{key} (\citeyear{key})`. Multiple: `(\cite{key1}; \cite{key2})`. Place citations close to the claim, not just at paragraph end.

Footnotes

In-line citations are preferred over footnotes. If you do use footnotes, they should be 8.5 pt with 14 pt line spacing. Example: `\footnote{Your footnote text here.}`

Reference list

References are handled by `\printbibliography`. They should be numbered, alphabetical by first author's last name. Same author with multiple papers: chronological order (oldest first). Same author and year: append a letter (e.g., 2018a, 2018b). Only include works cited in-line. The reference list does not count against the page count.

Heading 4 example

Run-in sidehead—*Heading 4* is a run-in sidehead in bold italics, followed by an em dash, flowing into the paragraph text. Use it as a list style rather than a heading style.
